

HeatBulk

Trans Ocean

more than flexible

TransOcean
bulk logistics solutions

More than innovation

Trans Ocean is well known for offering unique solutions in the bulk liquid transportation industry. We have achieved a reputation for leading by design and setting the standard.

The HeatBulk™ was developed and engineered to specifically allow highly viscous, heat dependent products to be carried and brought to a liquid state when you need to unload¹ your product.

Why HeatBulk™?

Exclusively developed & manufactured by the Trans Ocean Group.

The equipment is easy to operate combining universal fittings with 5 separate inlets and 5 separate outlets (for steam or hot water) allowing maximum and evenly distributed heat.

Maximises the largest heated area, by positioning the heat pad beneath the RhinoBulk™ flexitank (prior to loading), this also minimises 'hot spots' – Up to 66% more heating area than ISO tanks.

It combines the latest engineering design to capitalise on the efficiency and speed of unloading, through the use of dual heating coils and reinforced heat transfer hose.

¹ The heating pad is only to be used at the discharge point and is not used on products that require constant heating during transit.
